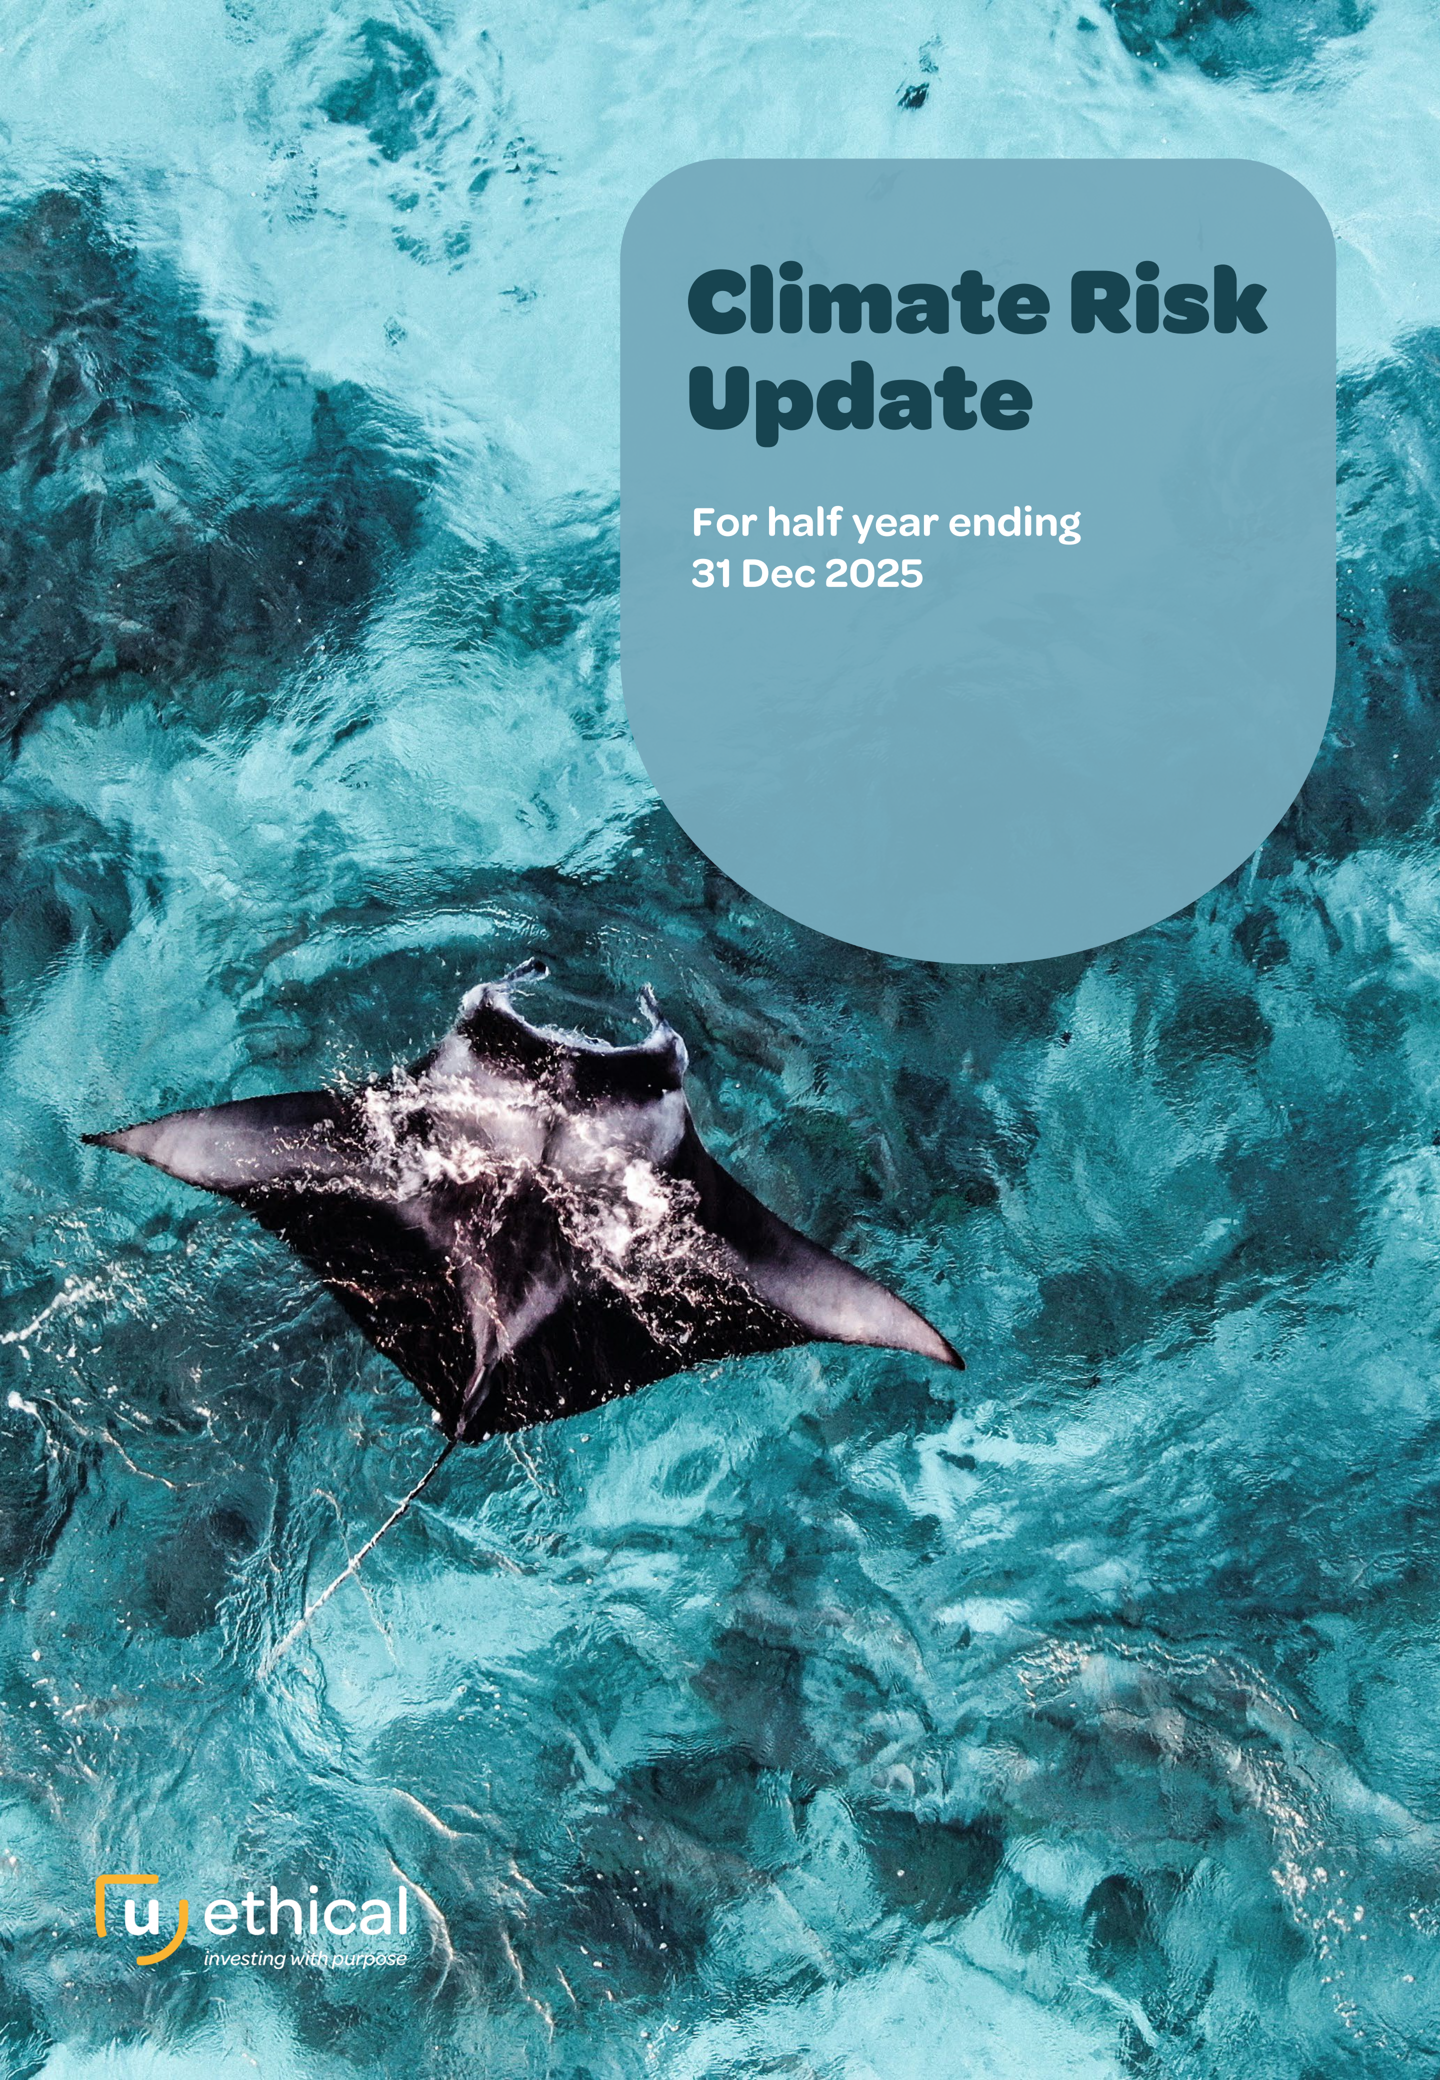
Climate Risk Update

For half year ending
31 Dec 2025



u ethical
investing with purpose

Summary

We are pleased to offer this update to the Climate Risk Report, which is intended to provide disclosure of relevant metrics as at 31 December 2025, as relates to the climate risks in our portfolios.

U Ethical aims to create long-term value for our clients while contributing to action with the goal of limiting climate change to 1.5° C above pre-industrial global temperature levels, in line with the Paris Agreement.

Our overall approach to governance, strategy and risk management was disclosed in our 2024 Climate Risk Report, and thus we have opted to provide a streamlined document with updated metrics covering what we track across our assets under management.

We measure:

- Carbon emissions, historical carbon emissions trends, carbon emissions intensity/$M invested and weighted average carbon intensity (WACI)
- Low carbon transition (LCT) management score and low carbon transition quartile scores, and
- The Climate Value-at-Risk (CVaR) and assess the concentration of risks in sectors and the exposure to physical and transition risks at a company and issuer level.

As part of the ESG profile reviews of companies and issuers, we assess the ESG risk exposures and related capabilities to manage both social and environmental key issues material to their sub-Global Industry Classification Standard (GICS). Active engagement focuses on human rights and labour management concerns, business governance and behaviour, environmental stewardship, and climate change risk.

For companies and issuers where climate risk has not been identified as financially material, we seek disclosures and consideration of climate risk in accepted warming scenarios within the relevant industry and best-practice. In proxy voting for equity holdings, we support resolutions that call for greater transparency and climate risk mitigation and adaptation strategies.

At present, we are reviewing the extent to which climate scenario analyses impact U Ethical's trusts and portfolios. We also review banks' financed emissions to identify areas of engagement via stewardship, seeking bank strategy alignment to the 1.5° Paris Agreement target. As described in the strategy section, our fundamental rating includes a 25% weighting to an ESG score.

Since the publication of the 2024 Climate Risk Report, we have enhanced the framework of the ESG Score to provide both breadth and depth of assessment across a wide range of material ESG risks and opportunities, including climate risk.

U Ethical have expanded the ESG score to include eleven components across four broad categories:

Business and Product Involvement:
Business Involvement, SDG Product Alignment

ESG Controversy & Norms-based Screening:
ESG Controversies, Norms-based Screening

Positive Contribution:
Overall ESG Rating, ESG Pillar Scores, Sustainable Impact

ESG Metrics:
Carbon Intensity (Scope 1+2), Implied Temperature Rise, Low Carbon Transition Management Score, Board Gender Diversity

U Ethical's fossil fuel exclusions significantly lower the carbon footprint of our equity trusts compared to their benchmarks.

Commentary

Carbon Intensity and Transition Management

Across most Portfolios, Carbon Intensity remains significantly below benchmark levels, reflecting the impact of U Ethical's negative screening approach, including the use of materiality thresholds for Fossil Fuels, in addition to broader ESG integration.

The largest contributors to portfolio weighted average carbon intensity are generally concentrated within sectors where decarbonisation pathways are more complex and transition risks are likely to remain present over time. This includes industries such as data centres, where operational high energy usage can result in higher carbon intensity. Carbon intensity should therefore be considered alongside the Low Carbon Transition Management Score, which assesses the quality of a company's decarbonisation strategy, governance and emissions management. Higher carbon intensity at a point in time does not necessarily indicate weaker climate preparedness, with some higher-emitting companies also demonstrating relatively strong transition management characteristics.

Implied Temperature Rise

While Implied Temperature Rise (ITR) metrics remain above 1.5°C, most Portfolios continue to demonstrate materially lower ITR values than their respective benchmarks.

While U Ethical seeks to support the transition toward a 1.5°C pathway, current portfolio ITR metrics remain above 1.5°C due to limitations in real-economy decarbonisation pathways, particularly within sectors critical to the transition. The portfolios include companies transitioning over time, and not all holdings are already fully aligned to a 1.5°C pathway today. Stewardship remains a critical tool through which U Ethical seeks to support continued improvement over time.

Climate Value-at-Risk

Transition risk, driven primarily by policy risk, remains the dominant driver of Climate Value-at-Risk within the Equity portfolios, while Fixed Income and Cash portfolios continue to show comparatively limited Climate Value-at-Risk exposure.
